Suzuki Kasami Algorithm:

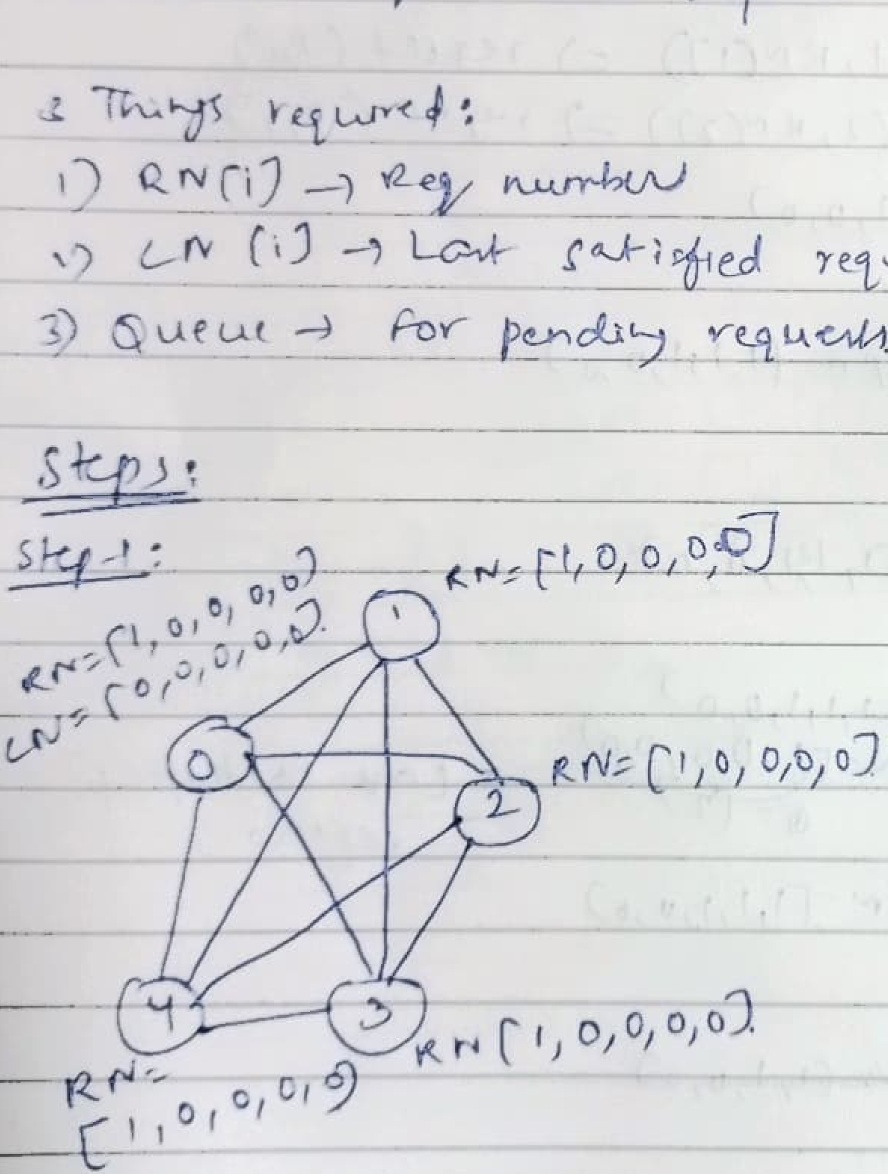
1) A unique token is shaued by site.
2) A site is allowed to enter critical section is it passes token.
3) Token setup is done before.

3 Things required:

1) RN[i] → Req number
2) LN [i] → Last satisfied request numser
3) Queue → for pending requests.

Steps:

Step-1:



RN₁ = [1,0,0,0,0]
LN = [0,0,0,0,0]
Queue = [ ]

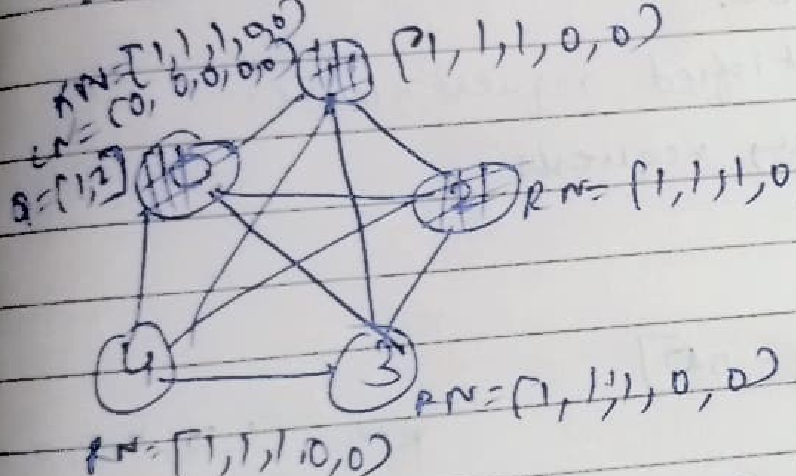
P0 is entering critical sectir

P0 holds status.

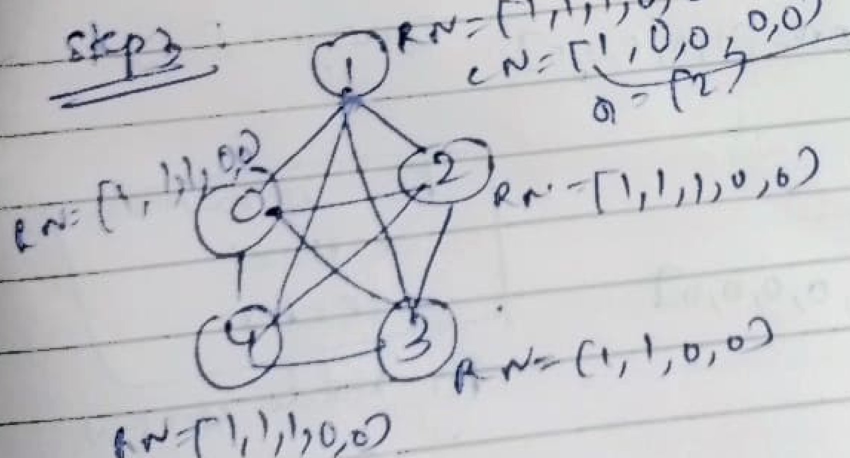
step2: $\boxed{\text{P1 + P2 wants to execute critical section}}$

P1, P2, send request. ↳ req(i, RN[i]) → process no; → incremented req.no

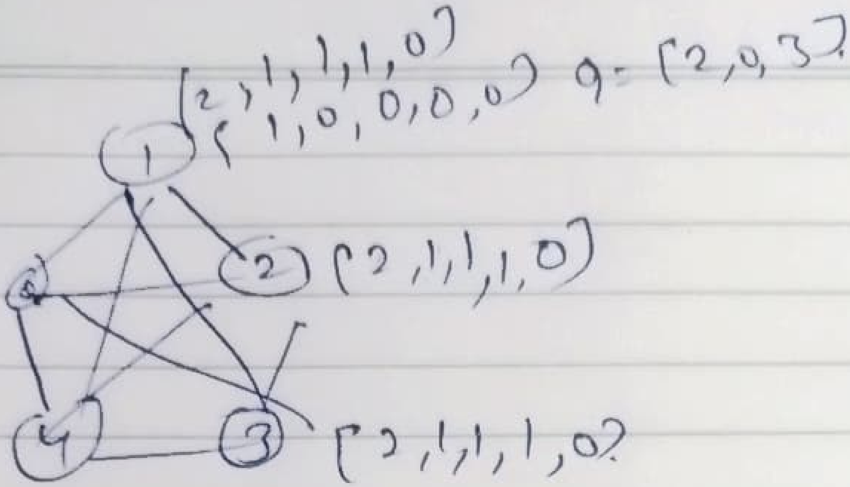
P1 sends, request(1, RN[1]) => request(1,1)
P2 sends, request(2, RN(2)) => request(2,1)



step3:



step4:



costs
